School of Science and Engineering

Assignment-2; Year 2023; Semester: Fall

Course: PHY 2105; Title: Physics, Section: O

Content: DHM+Progressive Wave+Standing Wave+Simple Pendulum+Vp-Vg

1. Draw displacement vs time graph for $\omega/\gamma = 10$, $\omega/\gamma = 0.5$, and $\omega/\gamma = 0.03$.
2. In oscillatory circuit $L = 0.4\text{h}$, $C = 0.0020\mu\text{F}$. (i) What is maximum value of resistance (R) for the circuit to be oscillatory? and (ii) What is its resonant frequency?
3. Find whether the discharge of capacitor through the following inductive series circuit is oscillatory or not. Given, $C = 0.1\mu\text{F}$, $L = 10\text{mh}$, and $R = 200\ \Omega$. If oscillatory, find the frequency of oscillation and resonant frequency. If it is parallel circuit, then find out the similar characteristics of that circuit.
4. For a damped oscillator $m = 250\text{gm}$, $k = 85\text{N/m}$ and $b = 70\text{gm/s}$. (i) What is the period of the motion? (ii) How long does it take for the amplitude of the damped oscillations to drop to half its initial value? (iii) How many oscillations does it complete in life time? (iv) What is its life time? (v) The maximum displacement of undamped oscillator is 35 cm. If the damping is stopped after 20 cycles, What is the damping energy? (vi) What is the ratio of the oscillation amplitude to the initial oscillation amplitude at this cycle?
5. The equation of a travelling wave is $y = 4.0\sin(0.10x - 2t)$. Find (i) amplitude, (ii) wavelength, (iii) speed, and (iv) frequency of wave.
6. At time $t=0$ the displacement of a particle in a medium is $y = 4.0\sin 2\pi(\frac{x}{100})$ and the velocity of wave is 30cm/s. Find the displacement equation when $t = 3\text{s}$.
7. When a simple harmonic wave is propagated through a medium, the displacement of the particle at any instant of time is given by $y = 5.0\sin \pi(360t - 0.15x)$. Calculate (i) the amplitude of the vibrating particle, (ii) wave velocity, (iii) wave length, (iv) frequency and (v) time period.
8. A simple harmonic wave of amplitude 8units travels a line of particles in the direction of positive X axis. At any instant for a particle at a distance of 10cm from the origin, the displacement is +6units and at a distance a particle from the origin is 25units, the displacement is +4units. Calculate the wavelength.
9. Determine the length and frequency of a simple pendulum that will swing back and forth in simple harmonic motion with a period of 5.00 s.
10. Find out the resultant amplitude, node and antinode points in terms of λ of the following equations:
 $y_1 = A \cos(\frac{1}{3}kx + \omega t)$ and $y_2 = A \cos(\frac{1}{3}kx - \omega t)$.
11. Suppose the displacement of a DHM is expressed as $x = Ae^{-\alpha t}\cos(\omega_d t + \delta)$. Show that total energy of DHM $E = E_0 e^{-2\alpha t}$.

12. Two cosine waves have phase velocity $C_1 = 2$ cm/s, $C_2 = 3$ cm/s, and corresponding wavelength $\lambda_1 = 4$ cm, $\lambda_2 = 3$ cm. Find out the angular frequency and group velocity.
13. Draw displacement vs time graph for a signal up to 3 cycles if the signal is $y(t) = 7e^{-\alpha t} \cos(6t + \phi)$.
14. A block of mass 1 kg attached to a spring is made to oscillate with an initial amplitude of 12 cm. After 2 minutes the amplitude decreases to 6 cm. Determine the value of the damping constant for this motion.
15. The mass of the block and the spring constant of a damped spring-mass system is 400 gm and 100 N/m, respectively. If the damping constant is 10 kg/sec, then find the time taken for its amplitude of vibrations to drop to half of its initial value.
16. A mobile phone tower transmits a wave signal of frequency 900MHz. Calculate the length of the waves transmitted from the mobile phone tower.
17. The equation of a progressive wave is given by $y = 5 \sin(100\pi t - 0.4\pi x)$. Calculate the (i) amplitude, (ii) wave length, (iii) frequency, (iv) time period, (v) wave velocity, (vi) angular frequency, (vii) maximum velocity, (viii) maximum acceleration, (viii) phase velocity, and (viii) instantaneous velocity, at $t = 3$ s and $x = 2$ m.
18. For a travelling wave the displacement is $y = 5 \sin 30\pi[t - (x/240)]$. Find the frequency of the wave.
