Department of Computer Science and Engineering

CSE 1115: Object Oriented Programming

CT-1 Trimester: Spring 2025 Section: G

Time: 40 minutes Marks: 20

Answer all questions

1. Create a class named **Student** with the following properties and methods: [16]

- A **String** variable **name** to store the student name. [1]
- An **int** variable **ID** to store the student ID. [1]
- An **int** variable **marks** to store the student's marks. [1]
- A method **displayDetails()** that prints the name, ID and marks of the student. [2]
- A method **hasPassed()** that prints "Passed" if the student's marks is 55 or higher, otherwise print "Failed". [4]

In the **main** method:

- Create an object of the **Student** class. [1]
- Assign values to its variables (**name**, **ID** and **marks**). [2]
- Call the **displayDetails()** method to print the student's name, ID and marks. [2]
- Call the **hasPassed()** method to print "Passed" or "Failed" [2]

2. Identify any errors in the program and provide a brief explanation for each in one or two lines. [4]

```
public class VariableScope {
    public static void main(String[] args) {
        for (int i = 0; i < 1; i++) {
            int x = 3;
            int y = i * x;
            System.out.println("Inside loop: x = " + x + ", i = " + i + ", y = " + y);
        }
        System.out.println("After loop: x = " + x);
        System.out.println("After loop: y = " + y);
    }
}
```
